

COS20019

Assignment 1A: Creating and deploying a web page

Due date: Week 6, via Canvas Studio screen recording

Weighting: 5%, graded as pass/fail.

Recommended requirements:

Before you begin this assignment, it's highly recommended that you complete the following tasks. Doing so ensures you are well-placed to succeed in what is being asked of you.

- ACF Labs 2 & 3.
- You will also need to create your own key pair and be able to access your EC2 instance via SSH using utilities like PuTTY and/or WinSCP. For more details, see **Remote Access to an EC2** file.

Please note that all supporting materials mentioned in this document can be found in the corresponding assignment page on Canvas.

Objectives

This assignment has the following objectives:

1. Get familiar with the AWS management console.
2. Launch your own EC2 instance.
3. Deploy your first PHP web page (PhotoAlbum) on Apache web server on your EC2 instance.

AWS Accounts

You have a choice of accounts/environments you can use to complete the assignments in this unit.

1. **AWS Academy Learner Lab (recommended):** accessible through AWS Canvas. Note that this is NOT the sandbox in ACA/ACF courses that you use for your weekly labs. This is a managed environment that allows your tutor to gain access to your AWS console so your work can be marked/troubleshooted. This class gives you US\$100 credit. **Use it carefully.** This account is deleted at the end of the semester.
2. **Regular AWS account (NOT recommended):** new AWS accounts are eligible for a free tier. This gives you more freedom, but you need to be careful as you will be charged for the services if you go outside the free tier offering. Make sure to keep track of your AWS services usage (using Billing & Cost Management Dashboard) throughout the semester to avoid paying fees. This account is on-going, but some services are no longer free after 12 months. If you choose this option, you will need to create a (read-only) IAM user and provide its credentials to your tutor so they can mark the assignment.

Your tasks

For this assignment, you will need to complete two tasks: launching your own Linux EC2 instance, and Create a PHP website (Photo Album)

Task 1: Launch your own Linux EC2 instance

Before launching an EC2 instance, a key pair is required for logging in to your instance in the future. For more details, see **Remote Access to an EC2** file.

Then launch an EC2 instance from the AWS management console in **US East (N. Virginia) us-east-1 region**. It must have the following properties:

- Amazon Machine Image: *Amazon Linux 2 AMI (HVM), SSD Volume Type*
- Instance type: *t2.micro*
- Advanced Details – User data: Use the script in **Auto Setup EC2 with script** file to automatically set up and configure the Apache server, PHP, and MySQL at launch.
- New security group named *WebServer-SG* that allows only necessary traffic types (SSH, HTTP, HTTPS) to reach the instance from anywhere. Do not allow every traffic types.

Other configurations should be left as default such as default Virtual Private Cloud (VPC), default subnet, etc.

Note: In this introductory assignment you will create an EC2 Web server in the default VPC. In general, the default VPC is suitable only for experimental / toy deployments, and its use is considered bad practice for production resources. In the next assignments, you will create your own secure VPC.

Allow a few minutes for the instance to launch and execute the commands in the above script, the Instance State and Status Check should change to 'running' and '2/2 checks passed', respectively.

After that, visit <http://your.public.dns.amazonaws.com/phpinfo.php>. If you see a welcome page, it means the EC2 instance, PHP, and Apache server have been installed correctly.

Note: Due to the pay-as-you-go pricing, the longer your instances run the more you pay. You are advised to stop the instances after each working session to save cost.

Task 2: Create a PHP website (Photo Album)

Create two PHP web pages (*photouploader.php* and *photolookup.php*) with user interfaces as illustrated in Figures 1 & 2. Feel free to individualise/style the web page as you wish.

Photo Album x Photo Album x Instances | EC2 Manag

← → ↻ ec2-44-195-24-5.compute-1.amazonaws.com/photoalbum/photouploader.html

Photo uploader

Figure 2 - Photo lookup page (photolookup.php). The “Photo Uploader” hyperlink at the bottom should link to photouploader.php

The directory structure of your website is described below. You can create additional HTML, CSS, PHP, JavaScript files if needed. The Apache HTTP server serves files located in a directory called Apache document root (/var/www/html); the *cos20019* folder must be in the Apache document root folder. Follow the instructions in **Remote Access to an EC2** file to learn how to transfer files to a Linux EC2 instance.

```
/var/www/html/cos20019/  
... AWS SDK, other support libraries  
photoalbum/  
photouploader.php  
photolookup.php  
... other PHP, HTML, CSS, JavaScript files
```

Note: File and directory names in Linux are case sensitive.

Note: You are not required to implement the actual functionalities of the website at this stage. After having the website deployed on the Apache server on your instance, your web page should be accessible from anywhere on the Internet via this URL:

<http://your.public.dns.amazonaws.com/cos20019/photoalbum/photouploader.php>

You should try accessing your website from different devices/networks/browsers to make sure it works correctly.

How to demonstrate your work

This assignment needs to be submitted as a screen recording, submitted through Canvas Studio. Please ensure you've read the details on using Canvas Studio before you attempt this assignment.

This is a formative assignment, which is an assignment designed to provide feedback and ensure you have mastered some basic techniques. If your assignment submission fails this time, you should reach out to your eLA for feedback and suggestions for improvement so you can master these skills as you move through this unit.
